

TIME SERIES FORECASTING PROJECT REPORT

Problem 1: Sparkling Wine

By Karthik Sreeram R

MAY 22, 2021

UNIVERSITY OF TEXAS AT AUSTIN AND GREAT LAKES

Purpose

This document is the business report for my final project in the subject “Time Series Forecasting”

This document gives us a detailed explanation of various approaches used, their insight and inferences.

Tools used analysis: Python and Jupiter notebook.

Packages used: NumPy, pandas, seaborn, os, matplotlib, stats model, sklearn and pylab

|--|----------|
| Problem 1: Sparkling Wine | 1 |
| Business scenario..... | 1 |
| Introduction: | 1 |
| 1.1) Reading the data as a Time Series data and plotting the data | 1 |
| a.) Dataset Head | 1 |
| Inference:..... | 1 |
| b.) Dataset Tail | 1 |
| Inference:..... | 2 |
| c.) Preprocessing of time series data..... | 2 |
| Inference:..... | 2 |
| c.) Plotting the time series data..... | 2 |
| Inference:..... | 3 |
| 1.2) Performing Exploratory Data Analysis to understand the data and to perform decomposition. | 3 |
| a) Description of Data | 3 |
| b) BOX PLOT :..... | 3 |
| Inference:..... | 4 |
| c.) Box plot yearly..... | 4 |
| Inference:..... | 4 |
| d) Box plot Monthly | 4 |
| Inference:..... | 4 |
| e) Decomposition of Sparkling variable time series | 5 |
| Inference:..... | 6 |
| f) Checking stationarity of whole data | 7 |
| Inference:..... | 7 |
| 1.3) Splitting the data into training and test. The test data starts in 1991. | 7 |
| a) Head and tail of train data | 7 |
| b) Head and tail of test data | 7 |
| Inference..... | 7 |
| 1.4) Building various time series models on the training data and evaluating the model performance using RMSE on the test data. | 8 |
| Exponential Smoothing | 8 |
| a.) Simple Exponential Smoothing with additive errors..... | 8 |
| 1. Autofit Params | 8 |
| 2. Simple Exponential Smoothing prediction plot on test data..... | 8 |
| 3. RMSE Score of Simple Exponential Smoothing: | 8 |
| b.) Double Exponential Smoothing - Holt's linear method with additive errors | 8 |

| | | |
|-------------|---|----|
| 1. | Autofit Params | 9 |
| 2. | Double Exponential Smoothing prediction plot on test data | 9 |
| 3. | RMSE Score of double Exponential Smoothing: | 9 |
| c.) | Triple Exponential Smoothing (addictive) - Holt Winter's linear method with additive errors | 9 |
| 1. | Autofit Params | 9 |
| 2. | Triple Exponential Smoothing prediction plot on test data | 10 |
| 3. | RMSE Score of Triple Exponential Smoothing (Addictive errors): | 10 |
| d.) | Triple Exponential Smoothing (Multiplicative) - Holt Winter's linear method | 10 |
| 1. | Autofit Params | 10 |
| 2. | Triple Exponential Smoothing prediction plot on test data | 11 |
| 3. | RMSE Score of Triple Exponential Smoothing (Multiplicative): | 11 |
| | Inference on Exponential Smoothing: | 12 |
| 1. | Comparison Table of RMSE OF Different model | 12 |
| 2. | Comparison of prediction on Multiple model | 12 |
| 3. | Insights | 12 |
| | Regression, Naïve forecast, and simple average models. | 12 |
| a.) | Linear Regression. | 12 |
| 1. | Creating linear instance (according to date) | 12 |
| 2. | Head of data set after adding linear Instance. | 13 |
| 3. | Building Linear Regression | 13 |
| 4. | Linear Regression prediction plot on test data | 13 |
| 5. | RMSE Score of Linear Regression: | 13 |
| b.) | Naïve Approach | 14 |
| 1. | Tail of train data | 14 |
| 2. | Head of Test data after applying Naïve Approach | 14 |
| 3. | Naïve Approach prediction plot on test data | 14 |
| 4. | RMSE Score of Naïve Approach: | 15 |
| c.) | Simple Average | 15 |
| 1. | Head of data set after creating mean forecast | 15 |
| 2. | Simple average prediction plot on test data | 15 |
| 3. | RMSE Score of simple Average: | 15 |
| | Inference on above given models: | 16 |
| 1. | Comparison Table of RMSE OF Different model | 16 |
| 2. | Comparison of prediction on Multiple model | 16 |
| 3. | Insights | 16 |
| 1.5) | Checking and changing the training data into stationary data using appropriate statistical tests and methods .Stationarity is checked at alpha = 0.05. | 16 |

| | |
|---|-----------|
| a.) Augmented Dickey–Fuller test Hypothesis for stationary data | 16 |
| b.) ADF test on train data | 17 |
| c.) ADF test on train data after one differencing | 17 |
| d.) Plotting of Data set after one differencing. | 17 |
| Comment / Inference:..... | 17 |
| 1.6) Building an automated version of the ARIMA/SARIMA model in which the parameters are selected using the lowest Akaike Information Criteria (AIC) on the training data and evaluating the performance of this model on the test data using RMSE. | 18 |
| a.) ARIMA model | 18 |
| 1.Creating different parameters for the model..... | 18 |
| 2.Building Arima model with different parameters | 18 |
| 2.Head of the Arima models with AIC score in ascending order | 19 |
| 3.Summary of the model after fitting it with the best parameters..... | 19 |
| 4.Diagnostics Plot..... | 19 |
| 5.ARIMA predication Plot on test data | 20 |
| 6.RMSE score on test data for Arima using lowest Akaike Information Criteria..... | 20 |
| b.) SARIMA model | 20 |
| 1.Creating different parameters for the model..... | 20 |
| 2.Building Sarima model with different parameters | 21 |
| 2.Head of the Sarima models with AIC score in ascending order | 21 |
| 3.Summary of the model after fitting it with the best parameters..... | 21 |
| 4.Diagnostics Plot..... | 22 |
| 5.SARIMA predication Plot on test data | 23 |
| 6.RMSE score of Sarima using lowest Akaike Information Criteria | 23 |
| Inference:..... | 23 |
| 1. Comparison Table of RMSE OF Different model..... | 23 |
| 2. Comparison Table of RMSE OF Different model..... | 23 |
| 3. Insights:..... | 24 |
| 1.7) Building ARIMA/SARIMA models based on the cut-off points of ACF and PACF on the training data and evaluating this model on the test data using RMSE. | 24 |
| a.) ARIMA model method using cut-off points of ACF and PACF..... | 24 |
| 1.ACF plot of train data | 24 |
| 2.PACF plot of train data | 24 |
| 3.Summary of the model after fitting it with the best parameters (3,1,2): | 25 |
| 4.Diagnostics Plot..... | 25 |
| 5.ARIMA predication Plot on test data | 26 |
| 6.RMSE score on test data for Arima using ACF AND PACF (Manual) | 26 |

| | |
|--|----|
| b.) SARIMA model cut-off points of ACF and PACF | 26 |
| 1.ACF plot of train data..... | 26 |
| 2.PACF plot of train data..... | 27 |
| 3.Summary of the model after fitting it with the best parameters (3,1,2) (3, 0, 0, 6) | 27 |
| 4.Diagnostics Plot..... | 28 |
| 5.SARIMA predication Plot on test data (manual)..... | 28 |
| 6.RMSE score of Sarima using ACF AND PACF cutoff (Manual) | 29 |
| Inference: | 29 |
| 1. Comparison Table of RMSE OF Different model..... | 29 |
| 2. Comparison graph of Different model..... | 29 |
| 3. Insights | 29 |
| 1.8) Building a table with all the models built along with their corresponding parameters and the respective RMSE values on the test data. | 29 |
| Model Performance comparison table | 30 |
| Forecasting comparison plot. | 30 |
| Inference: | 30 |
| 1.9) Based on the model-building exercise, building the most optimum model on the complete data and predicting 12 months into the future with appropriate confidence intervals/bands. | 31 |
| Summary of optimized model on complete data | 31 |
| Forecasted value | 31 |
| Plotting the forecast (mean value) of the whole data. | 32 |
| Forecasted value description. | 32 |
| 10. Comment on the model thus built and report your findings and suggest the measures that the company should be taking for future sales. | 32 |
| Analytical Insights: | 32 |
| Business Recommendations: | 33 |

Problem 1: Sparkling Wine

Business scenario

For this assignment, the data of different types of wine sales in the 20th century is to be analyzed. Both data are from the same company but of different wines. As an analyst in the ABC Estate Wines, you are tasked to analyze and forecast Wine Sales in the 20th century.

Introduction:

The purpose of this assignment is to understand the time series data, do exploratory analysis, perform decomposition to understand the trend and seasonality of the data , train the data with different models of forecasting to predict the future sales of the sparkling wine .It will help the ABC estate to pre stock the sparkling wine for future sales based on demand (predicted sales).

Data has two fields.

YearMonth – monthly data

Sparkling – sales count of sparkling wine.

1.1) Reading the data as a Time Series data and plotting the data

a.) Dataset Head

| | YearMonth | Sparkling |
|---|-----------|-----------|
| 0 | 1980-01 | 1686 |
| 1 | 1980-02 | 1591 |
| 2 | 1980-03 | 2304 |
| 3 | 1980-04 | 1712 |
| 4 | 1980-05 | 1471 |

Inference:

The data is month wise data starting from January 1980. The data format is year and month (YYYY-mm)

b.) Dataset Tail

| | YearMonth | Sparkling |
|-----|-----------|-----------|
| 182 | 1995-03 | 1897 |
| 183 | 1995-04 | 1862 |
| 184 | 1995-05 | 1670 |
| 185 | 1995-06 | 1688 |
| 186 | 1995-07 | 2031 |

Inference:

The data ends in July 1995. The row count and total number of months between January 1980 and July 1995 matches (i.e., 187 months)

c.) Preprocessing of time series data

1. Creating dummy month wise date data in time stamp format from the January 1980 to July 1995.

```
DatetimeIndex(['1980-01-31', '1980-02-29', '1980-03-31', '1980-04-30',
               '1980-05-31', '1980-06-30', '1980-07-31', '1980-08-31',
               '1980-09-30', '1980-10-31',
               ...,
               '1994-10-31', '1994-11-30', '1994-12-31', '1995-01-31',
               '1995-02-28', '1995-03-31', '1995-04-30', '1995-05-31',
               '1995-06-30', '1995-07-31'],
              dtype='datetime64[ns]', length=187, freq='M')
```

2. Add dummy data column to the original data set.

| 4]: | YearMonth | Sparkling | Time_Stamp |
|-----|-----------|-----------|------------|
| 0 | 1980-01 | 1686 | 1980-01-31 |
| 1 | 1980-02 | 1591 | 1980-02-29 |
| 2 | 1980-03 | 2304 | 1980-03-31 |
| 3 | 1980-04 | 1712 | 1980-04-30 |
| 4 | 1980-05 | 1471 | 1980-05-31 |

Inference:

For time series model data must be in the format YYYY-mm-dd i.e., time stamp format. Our data has date data as YYYY-mm format. So, a dummy time stamp is created to replace the YearMonth field and changed into index.

c.) Plotting the time series data.

Inference:

There is a seasonality in the data. Looks like there is no upward or downward trend in the data.
There is a seasonality in the data.

1.2) Performing Exploratory Data Analysis to understand the data and to perform decomposition.

a) Description of Data

Basic Descriptive Stats of Time series

```
9]: Sparkling
```

| | |
|-------|----------|
| count | 187.000 |
| mean | 2402.417 |
| std | 1295.112 |
| min | 1070.000 |
| 25% | 1605.000 |
| 50% | 1874.000 |
| 75% | 2549.000 |
| max | 7242.000 |

b) BOX PLOT :

Inference:

More than 75 percent of sales quantity fall below 2549. Average sale count is 2402. The count of Sparkling field is 187 which is equal to number of months. so There is no missing data for sparkling field (sales).

c.) Box plot yearly

Inference:

Year over year comparison shows that the data has no uniform (increase or decrease) patterns. I.e., no clear trend It keeps changing.

d) Box plot Monthly

Inference:

Month over month comparison shows that the data seasonality. It has increasing sales trend from July to December and decreasing sales trend from January to June. The maximum sales are during December and minimum sales is in June.

e) Decomposition of Sparkling variable time series

1. Addictive decomposition

```
Trend
Time_Stamp
1980-01-31      NaN
1980-02-29      NaN

1980-11-30    1.690158
1980-12-31    2.384776
Name: seasonal, dtype: float64

Residual
Time_Stamp
1980-01-31      NaN
1980-02-29      NaN
1980-03-31      NaN
1980-04-30      NaN
1980-05-31      NaN
1980-06-30      NaN
1980-07-31    1.029230
1980-08-31    1.135407
1980-09-30    0.955954
1980-10-31    0.907513
1980-11-30    1.050423
1980-12-31    0.946770
Name: resid, dtype: float64

```

Inference:

There is no pattern in the residual. seasonality and residual components are independent of the trend. So, it is additive.

f) Checking stationarity of whole data

```
checking seasonlity on whole data
DF test statistic is -1.798
DF test p-value is 0.7055958459932397
Number of lags used 12
fail to reject null hypothesis . its not stationary (p value is > 0.05 (alpha))
```

Inference:

Whole Data is not stationary at $\alpha = 0.05$

1.3) Splitting the data into training and test. The test data starts in 1991.

a) Head and tail of train data

| Head of train data | | Tail of train data | |
|--------------------|------|--------------------|------|
| Sparkling | | Sparkling | |
| Time_Stamp | | Time_Stamp | |
| 1980-01-31 | 1686 | 1990-08-31 | 1605 |
| 1980-02-29 | 1591 | 1990-09-30 | 2424 |
| 1980-03-31 | 2304 | 1990-10-31 | 3116 |
| 1980-04-30 | 1712 | 1990-11-30 | 4286 |
| 1980-05-31 | 1471 | 1990-12-31 | 6047 |

b) Head and tail of test data

| Head of test data | | Tail of test data | |
|-------------------|------|-------------------|------|
| Sparkling | | Sparkling | |
| Time_Stamp | | Time_Stamp | |
| 1991-01-31 | 1902 | 1995-03-31 | 1897 |
| 1991-02-28 | 2049 | 1995-04-30 | 1862 |
| 1991-03-31 | 1874 | 1995-05-31 | 1670 |
| 1991-04-30 | 1279 | 1995-06-30 | 1688 |
| 1991-05-31 | 1432 | 1995-07-31 | 2031 |

Inference

Data is split into train and split. Train data is from January 1980 December 1990. Test data is from Jan 1991.

1.4) Building various time series models on the training data and evaluating the model performance using RMSE on the test data.

Exponential Smoothing

a.) Simple Exponential Smoothing with additive errors.

1. Autofit Params

```
: {'smoothing_level': 0.07028781460389563,  
  'smoothing_trend': nan,  
  'smoothing_seasonal': nan,  
  'damping_trend': nan,  
  'initial_level': 1763.9269926897732,  
  'initial_trend': nan,  
  'initial_seasons': array([], dtype=float64),  
  'use_boxcox': False,  
  'lamda': None,  
  'remove_bias': False}
```

2. Simple Exponential Smoothing prediction plot on test data

3. RMSE Score of Simple Exponential Smoothing:

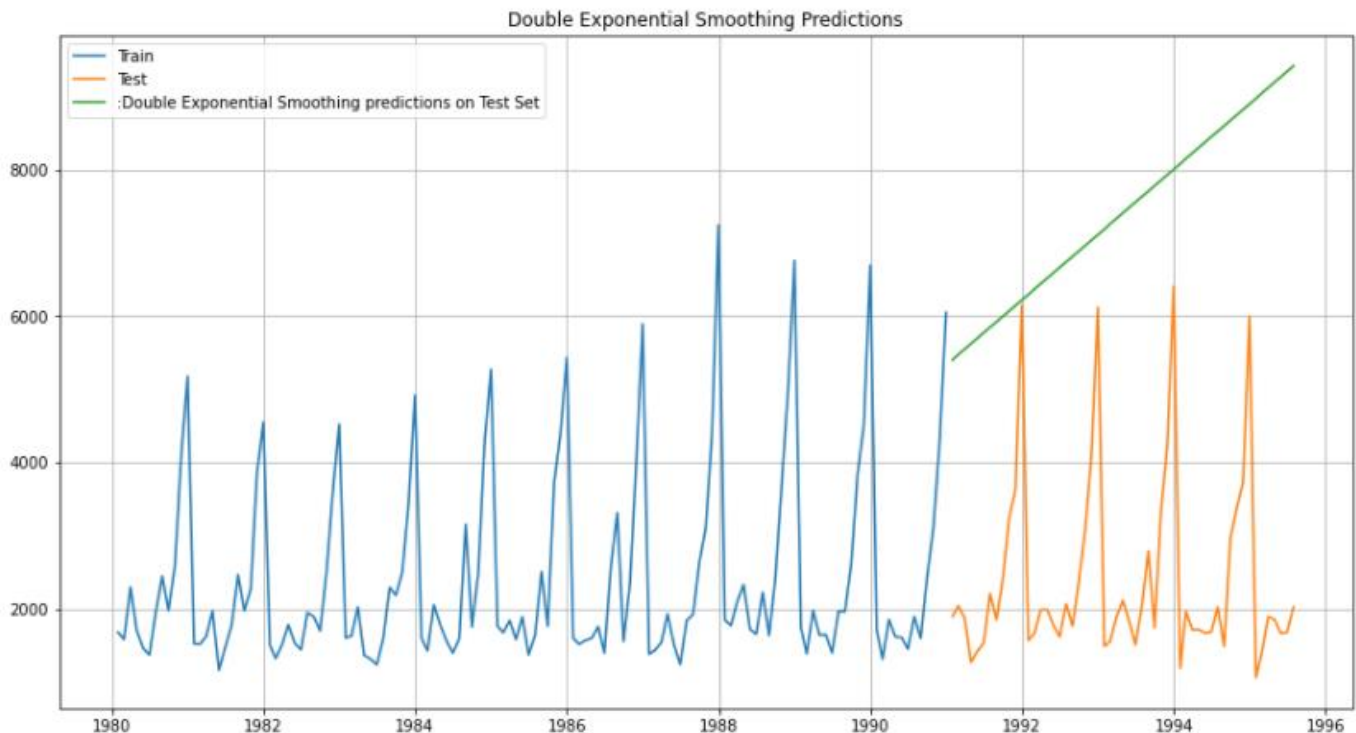

SES RMSE: 1338.0046232563645

b.) Double Exponential Smoothing - Holt's linear method with additive errors

1. Autofit Params

```
{'smoothing_level': 0.6649999999999999,  
'smoothing_trend': 0.0001,  
'smoothing_seasonal': nan,  
'damping_trend': nan,  
'initial_level': 1502.1999999999998,  
'initial_trend': 74.87272727272733,  
'initial_seasons': array([], dtype=float64),  
'use_boxcox': False,  
'lamda': None,  
'remove_bias': False}
```

2. Double Exponential Smoothing prediction plot on test data

3. RMSE Score of double Exponential Smoothing:

DES RMSE: 5291.879833226911

c.) Triple Exponential Smoothing (additive) - Holt Winter's linear method with additive errors

1. Autofit Params

```

: {'smoothing_level': 0.11127217859992398,
'smoothing_trend': 0.01236078328796452,
'smoothing_seasonal': 0.4607177642170641,
'damping_trend': nan,
'initial_level': 2356.578308185137,
'initial_trend': -0.01853556812789492,
'initial_seasons': array([-636.23360535, -722.98363367, -398.6436108 , -473.43084469,
-808.42525514, -815.35024951, -384.23066987, 72.99508063,
-237.44272911, 272.32584554, 1541.3782103 , 2590.0775386 ]),
'use_boxcox': False,
'lamda': None,
'remove_bias': False}

```

2. Triple Exponential Smoothing prediction plot on test data

3. RMSE Score of Triple Exponential Smoothing (Addictive errors):

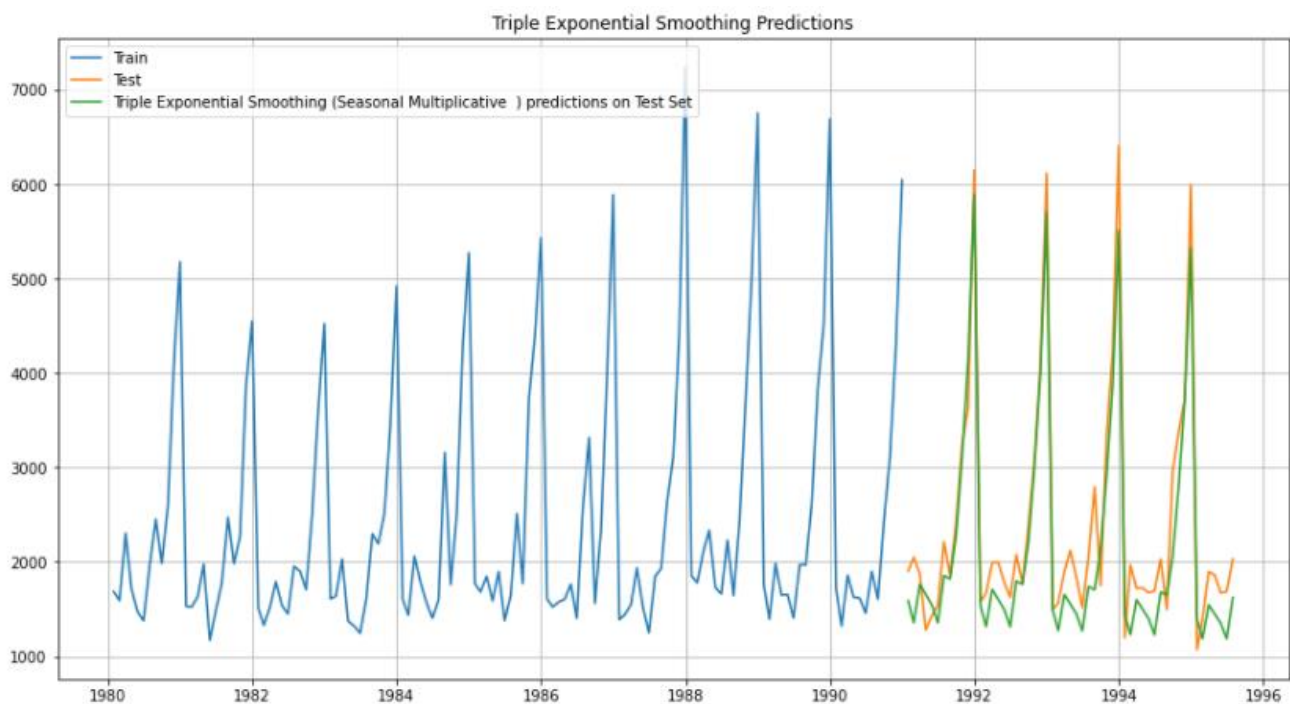

TES RMSE: 378.6262408893861

d.) Triple Exponential Smoothing (Multiplicative) - Holt Winter's linear method

1. Autofit Params

```
: {'smoothing_level': 0.11119949831569428,
  'smoothing_trend': 0.049430920023313805,
  'smoothing_seasonal': 0.3620525701498937,
  'damping_trend': nan,
  'initial_level': 2356.5264391986907,
  'initial_trend': -9.443690175376352,
  'initial_seasons': array([0.71325627, 0.68332509, 0.90537798, 0.80561841, 0.65639659,
                           0.65451508, 0.88690241, 1.13423953, 0.91927727, 1.21396745,
                           1.86941738, 2.3734461 ]),
  'use_boxcox': False,
  'lamda': None,
  'remove_bias': False}
```

2. Triple Exponential Smoothing prediction plot on test data

3. RMSE Score of Triple Exponential Smoothing (Multiplicative):

TES_am RMSE: 403.7062277856435

Inference on Exponential Smoothing:

1. Comparison Table of RMSE OF Different model

| | Test RMSE |
|--------|-------------|
| SES | 1338.004623 |
| DES | 5291.879833 |
| TES A | 378.626241 |
| TES SM | 403.706228 |

2. Comparison of prediction on Multiple model

3. Insights

In exponential smoothing, Holt Winter's linear method with additive errors (Triple Exponential Smoothing (additive)) is the best model based on least RMSE score.

Regression, Naïve forecast, and simple average models.

a.) Linear Regression.

1. Creating linear instance (according to date)

```

Training Time instance
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132]
Test Time instance
[133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187]

```

2. Head of data set after adding linear Instance.

```
1]:
```

| Time_Stamp | Sparkling | time |
|------------|-----------|------|
| 1980-01-31 | 1686 | 1 |
| 1980-02-29 | 1591 | 2 |
| 1980-03-31 | 2304 | 3 |
| 1980-04-30 | 1712 | 4 |
| 1980-05-31 | 1471 | 5 |

3. Building Linear Regression

LinearRegression()

4. Linear Regression prediction plot on test data

5. RMSE Score of Linear Regression:

For Regression forecast on the Test Data, RMSE is 1389.135

b.) Naïve Approach

1. Tail of train data

```
3]:
```

| Sparkling | |
|------------|------|
| Time_Stamp | |
| 1990-08-31 | 1605 |
| 1990-09-30 | 2424 |
| 1990-10-31 | 3116 |
| 1990-11-30 | 4286 |
| 1990-12-31 | 6047 |

2. Head of Test data after applying Naïve Approach.

| Time_Stamp | |
|------------|------|
| 1991-01-31 | 6047 |
| 1991-02-28 | 6047 |
| 1991-03-31 | 6047 |
| 1991-04-30 | 6047 |
| 1991-05-31 | 6047 |

3. Naïve Approach prediction plot on test data

4. RMSE Score of Naïve Approach:

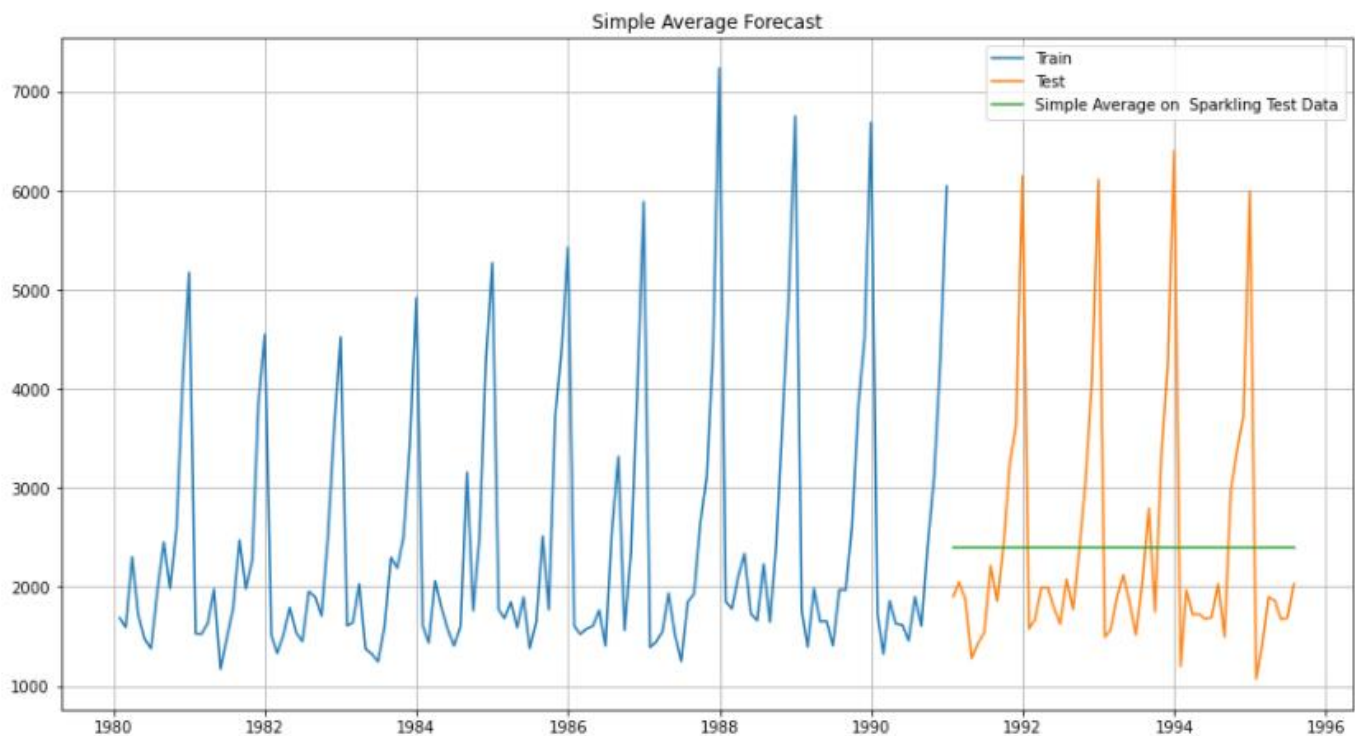

For Naive forecast on the sparkling Test Data, RMSE is 3864.279

c.) Simple Average

1. Head of data set after creating mean forecast.

| | Sparkling | mean_forecast |
|------------|-----------|---------------|
| Time_Stamp | | |
| 1991-01-31 | 1902 | 2403.780303 |
| 1991-02-28 | 2049 | 2403.780303 |
| 1991-03-31 | 1874 | 2403.780303 |
| 1991-04-30 | 1279 | 2403.780303 |
| 1991-05-31 | 1432 | 2403.780303 |

2. Simple average prediction plot on test data

3. RMSE Score of simple Average:

For Simple Average forecast on the Test Data, RMSE is 1275.082

Inference on above given models:

1. Comparison Table of RMSE OF Different model

| | Test RMSE |
|--------------------|-------------|
| SES | 1338.004623 |
| DES | 5291.879833 |
| TES A | 378.626241 |
| TES SM | 403.706228 |
| Regression | 1389.135175 |
| NaiveModel | 3864.279352 |
| SimpleAverageModel | 1275.081804 |

2. Comparison of prediction on Multiple model

3. Insights

In above analyzed models, Holt Winter's linear method with additive errors (Triple Exponential Smoothing (additive)) is the best model based on least RMSE score. I.e. it will be able to forecast the sales with least errors compared to other analyzed models.

1.5) Checking and changing the training data into stationary data using appropriate statistical tests and methods. Stationarity is checked at $\alpha = 0.05$.

a.) Augmented Dickey–Fuller test Hypothesis for stationary data

The hypothesis in a simple form for the ADF test is:

- H_0 : The Time Series has a unit root and is thus non-stationary.
- H_1 : The Time Series does not have a unit root and is thus stationary.

We would want the series to be stationary for building ARIMA models and thus we would want the p-value of this test to be less than the alpha value.

b.) ADF test on train data

```
DF test statistic is -2.062
DF test p-value is 0.5674110388593719
Number of lags used 12
fail to reject null hypothesis . its not stationary
```

The training data is non-stationary at 95% confidence level. Let us take a first level of differencing to stationarize the Time Series.

c.) ADF test on train data after one differencing

```
DF test statistic is -7.968
DF test p-value is 8.479210655514579e-11
Number of lags used 11
reject Null hypothesis ie its statioary
```

d.) Plotting of Data set after one differencing.

Comment / Inference:

Actual Train data is not stationary. After one differencing data has become stationary

Testing for stationarity is very important because the whole results of the regression might be fabricated thus predication may not be proper if data is nonstationary.

1.6) Building an automated version of the ARIMA/SARIMA model in which the parameters are selected using the lowest Akaike Information Criteria (AIC) on the training data and evaluating the performance of this model on the test data using RMSE.

The data has some seasonality so ideally, we should build a SARIMA model. But for confirmation I am building an ARIMA model by looking at the minimum AIC criterion.

a.) ARIMA model

1.Creating different parameters for the model.

Examples of the parameter combinations for the Model

```
Model: (0, 1, 0)
Model: (0, 1, 1)
Model: (0, 1, 2)
Model: (0, 1, 3)
Model: (1, 1, 0)
Model: (1, 1, 1)
Model: (1, 1, 2)
Model: (1, 1, 3)
Model: (2, 1, 0)
Model: (2, 1, 1)
Model: (2, 1, 2)
Model: (2, 1, 3)
Model: (3, 1, 0)
Model: (3, 1, 1)
Model: (3, 1, 2)
Model: (3, 1, 3)
```

I have kept the d value as 1 as we have analyzed that we must differentiate it by 1 to make the data stationary.

2.Building Arima model with different parameters

```
ARIMA(0, 1, 0) - AIC:2267.6630357855465
ARIMA(0, 1, 1) - AIC:2263.0600155922552
ARIMA(0, 1, 2) - AIC:2234.4083231242757
ARIMA(0, 1, 3) - AIC:2233.994857747629
ARIMA(1, 1, 0) - AIC:2266.608539319009
ARIMA(1, 1, 1) - AIC:2235.755094669173
D:\anocondal\lib\site-packages\statsmodel
warn('Non-invertible starting MA parame
ARIMA(1, 1, 2) - AIC:2234.5272004516546
ARIMA(1, 1, 3) - AIC:2235.607808732252
ARIMA(2, 1, 0) - AIC:2260.3657439680865
ARIMA(2, 1, 1) - AIC:2233.777626209401
ARIMA(2, 1, 2) - AIC:2213.509212785536
D:\anocondal\lib\site-packages\statsmodel
warnings.warn("Maximum Likelihood optim
ARIMA(2, 1, 3) - AIC:2232.8110262733007
ARIMA(3, 1, 0) - AIC:2257.723378997941
ARIMA(3, 1, 1) - AIC:2235.498940717457
D:\anocondal\lib\site-packages\statsmodel
warnings.warn("Maximum Likelihood optim
ARIMA(3, 1, 2) - AIC:2230.754792087503
ARIMA(3, 1, 3) - AIC:2221.4554497355275
```

2.Head of the Arima models with AIC score in ascending order

| | param | AIC |
|----|-----------|-------------|
| 10 | (2, 1, 2) | 2213.509213 |
| 15 | (3, 1, 3) | 2221.455450 |
| 14 | (3, 1, 2) | 2230.754792 |
| 11 | (2, 1, 3) | 2232.811026 |
| 9 | (2, 1, 1) | 2233.777626 |

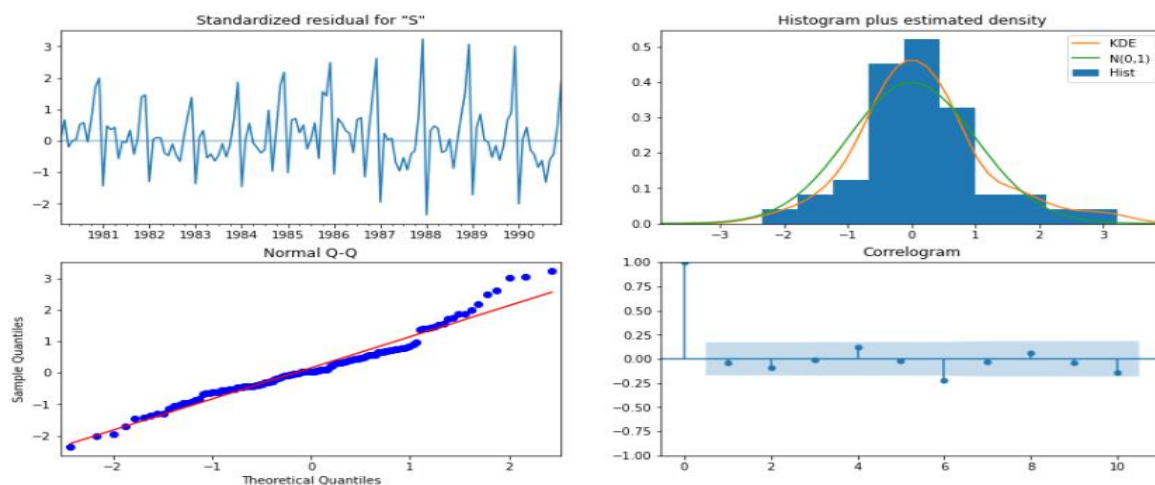

Model with parameter (2,1,2) has the least AIC score. So, it is the best parameter

3.Summary of the model after fitting it with the best parameters

```
warnings.warn('No frequency information was')

[2] Covariance matrix is singular or near-singular, with condition number 2.41e+28. Standard errors may be unstable.
```

4.Diagnostics Plot

5.ARIMA predication Plot on test data

6.RMSE score on test data for Arima using lowest Akaike Information Criteria

RMSE: 1299.9808693008124

b.) SARIMA model

1.Creating different parameters for the model.

Examples of the parameter combinations for the Model are

```
Model: (0, 1, 1)(0, 0, 1, 6)
Model: (0, 1, 2)(0, 0, 2, 6)
Model: (0, 1, 3)(0, 0, 3, 6)
Model: (1, 1, 0)(1, 0, 0, 6)
Model: (1, 1, 1)(1, 0, 1, 6)
Model: (1, 1, 2)(1, 0, 2, 6)
Model: (1, 1, 3)(1, 0, 3, 6)
Model: (2, 1, 0)(2, 0, 0, 6)
Model: (2, 1, 1)(2, 0, 1, 6)
Model: (2, 1, 2)(2, 0, 2, 6)
Model: (2, 1, 3)(2, 0, 3, 6)
Model: (3, 1, 0)(3, 0, 0, 6)
Model: (3, 1, 1)(3, 0, 1, 6)
Model: (3, 1, 2)(3, 0, 2, 6)
Model: (3, 1, 3)(3, 0, 3, 6)
```

I have kept the d value as 1 as we have analyzed that we must differentiate it by 1 to make the data stationary.

As we are not applying any additional differentiate for seasonal data D value stays as zero

2. Building Sarima model with different parameters

In the below images we have shown only the few parameter combinations

```
SARIMA(0, 1, 0)x(0, 0, 0, 6) - AIC:2251.3597196862966
SARIMA(0, 1, 0)x(0, 0, 1, 6) - AIC:2152.378076171629

4.Diagnostics Plot

5. ARIMA predication Plot on test data

6. RMSE score on test data for Arima using ACF AND PACF (Manual)

RMSE: 1281.7511774185691

b.) SARIMA model cut-off points of ACF and PACF

1. ACF plot of train data.

Based on ACF plot q value is 2. (ie 2nd lag is out of confidence level and next lag drops below confidence level) Q value is zero because there is no significant lag trend.

Example: if I take 2nd lag as significance, there 4th lag is not significant, and we have chosen seasonality to be 6 so we cannot have Q as 6 also. So, Q value is 0.

2.PACF plot of train data

Based on PACF plot p value is 3. (i.e. 2nd and 3rd lag is out of confidence level and next lag drops below confidence level) and P value is 3 cos there is a seasonality trend for every 3rd significant lags there is a cut off.

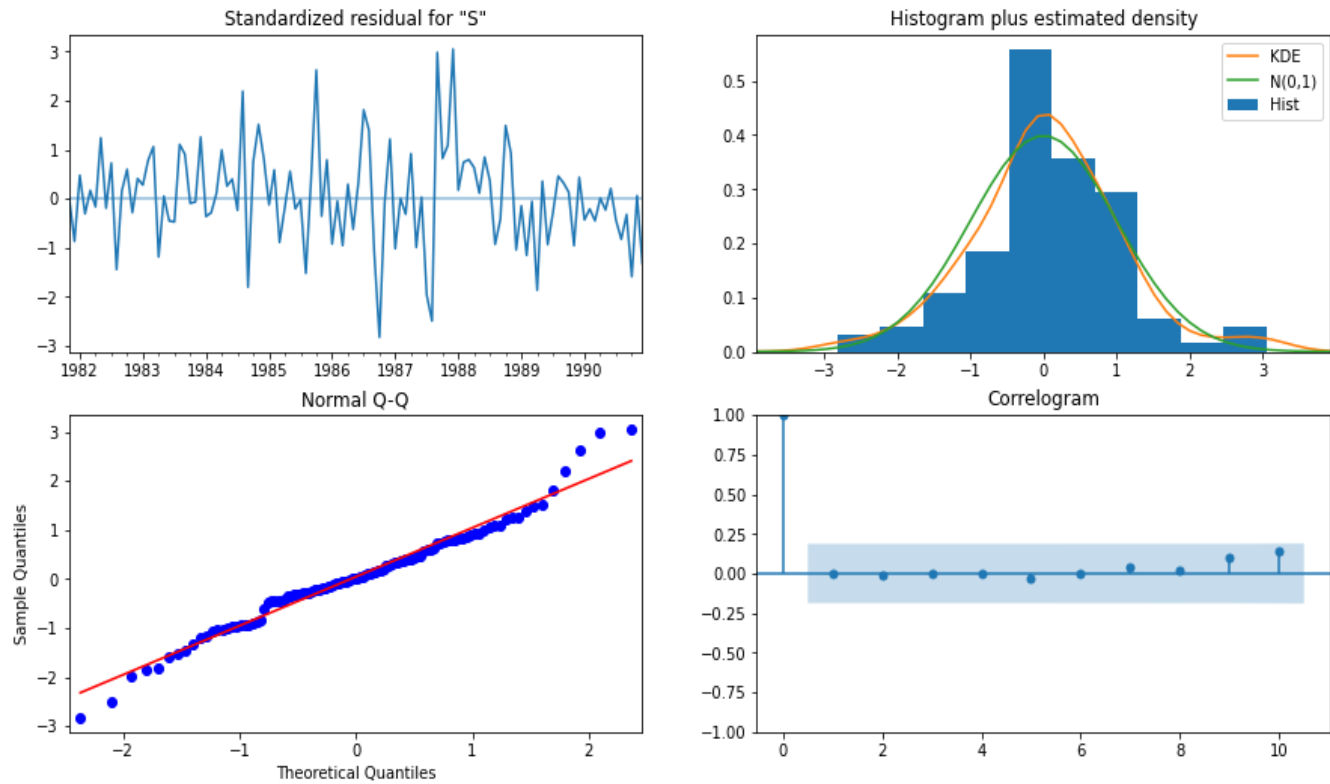

I have kept the d value as 1 as we have analyzed that we must differentiate it by 1 to make the data stationary. We do not differentiate again D is 0.

So, the parameter is (3,1,2) (3, 0, 0, 6)

3.Summary of the model after fitting it with the best parameters (3,1,2) (3, 0, 0, 6)

4. Diagnostics Plot

5. SARIMA predication Plot on test data (manual)

6. RMSE score of Sarima using ACF AND PACF cutoff (Manual)

RMSE: 321.8681761919399

Inference:

1. Comparison Table of RMSE OF Different model

| | RMSE |
|--------------------------|-------------|
| ARIMA M(3,1,2) | 1281.751177 |
| SARIMA M(3,1,2)(3,0,0,6) | 321.868176 |

2. Comparison graph of Different model

3. Insights

RMSE has reduced in comparison to ARIMA when seasonality was introduced.

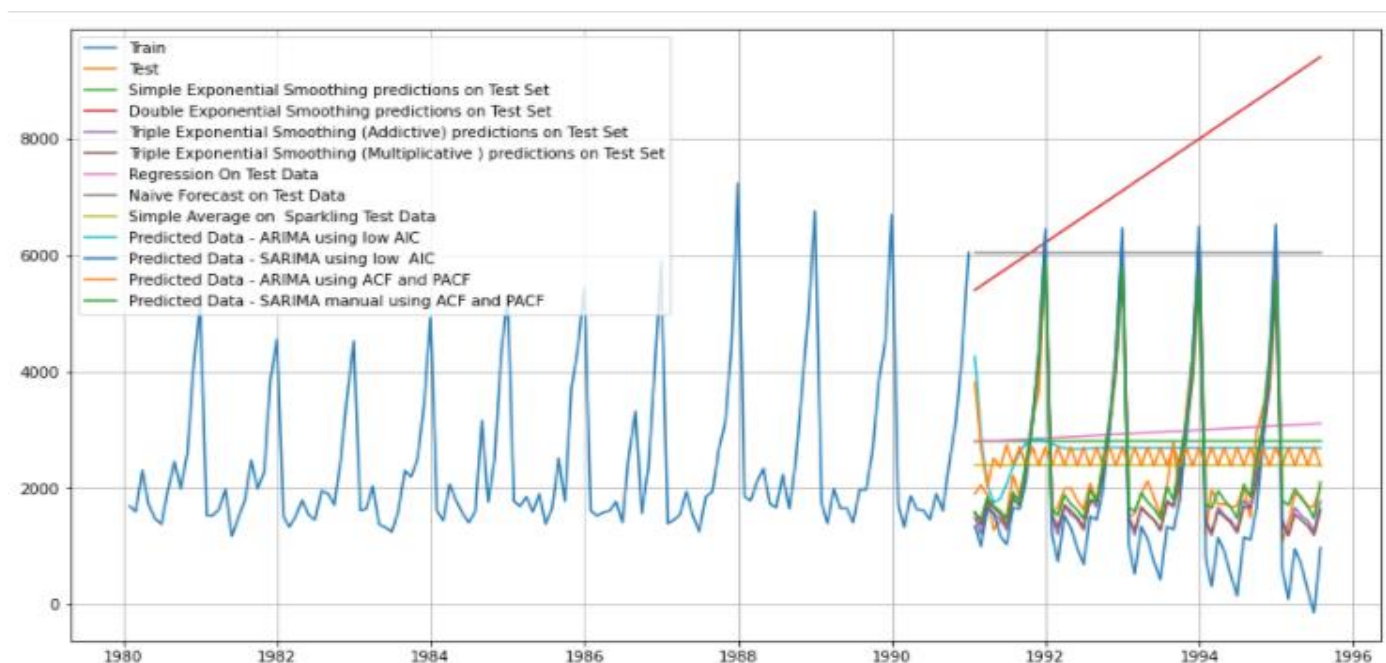

SARIMA with using ACF AND PACF cutoff has the least RMSE score. So, it can forecast with least error.

1.8) Building a table with all the models built along with their corresponding parameters and the respective RMSE values on the test data.

Model Performance comparison table

| | Test RMSE | MAPE |
|--|-------------|------------|
| SES (Alpha=0.0702) | 1338.004623 | 53.879778 |
| DES (Alpha=0.6649,Beta=0.0001) | 5291.879833 | 268.912388 |
| TES (Alpha=0.1112,Beta=0.01236,Gamma=0.4607):Addictive | 378.626241 | 53.618933 |
| TES (Alpha=0.1111,Beta=0.0494,Gamma=0.3620):Multiplicative | 403.706228 | 48.365465 |
| Regression | 1389.135175 | 59.410392 |
| NaiveModel | 3864.279352 | 201.327650 |
| SimpleAverage | 1275.081804 | 39.157336 |
| Arima (2,1,2) : Low AIC | 1299.980869 | 47.100060 |
| Sarima (2, 1, 3)(2, 0, 3,6), :Low AIC | 820.623812 | 36.126725 |
| Arima (3,1,2) : cut-off points of ACF and PACF | 1281.751177 | 44.067516 |
| Sarima (3, 1, 2)(3, 0, 0,6), :cut-off points of ACF and PACF | 321.868176 | 11.391015 |

Forecasting comparison plot.

Inference:

Based on the above table, we can see that SARIMA(3,1,2)(3,0,0,6) with using ACF AND PACF cutoff has the least RMSE score. It MAPE of around 11.3 percent. So, it will be able to forecast the future with least error.

1.9) Based on the model-building exercise, building the most optimum model on the complete data and predicting 12 months into the future with appropriate confidence intervals/bands.

Best model is SARIMA with using ACF AND PACF cutoff with parameter of (3,1,2) (3,0,0,6)

10. Comment on the model thus built and report your findings and suggest the measures that the company should be taking for future sales.

Analytical Insights:

- I have formatted the data into time series data by creating time stamp instead of YearMonth date field. It is a monthly data from January 1980 to July 1995.

- Did exploratory analysis and found out that there is no missing data, and more than 75 percent of data has sales count of 2549 and below with average sales count being 2402.
- performed decomposition to understand that there is no uniform trend. It keeps changing over time.
- There is a seasonality in the data. Peak sales are in December and least sales are in June. this suggest that the sales of Sparkling wine follow a festive seasonality.
- Have split the data into train and test. Train data is from January 1980 December 1990. Test data is from Jan 1991 till July 1995 (end of the data set).
- Using Stationary test, we have found that the dataset is not stationary. After one differencing It becomes stationary.
- Have analyzed the data using various time series models and found out that SARIMA (3,1,2) (3,0,0,6) (using ACF AND PACF cutoff) is the most optimized model with least RMSE score.
- Have predicted the data for next 12 months using the SARIMA model with parameters of (3,1,2) (3,0,0,6) (The most optimized model). The maximum forecasted average sales will be in December 1995 with the count of 5889. The average sales count will be 2443.
- Forecasting for 12 months (Month wise sales count :

Business Recommendations:

- I suggest the “ABC Estate Wines “to have average stock up a minimum of 2450 sparkling wine every month.
- I suggest them to increase the stock by 10 percent every month for the time July to October and increase the stock by 25 percent each month for the month of November and December.

- I recommend them to have a stock of 6724 sparkling wine during December which is the forecasted maximum average sale count.
- The difference between forecasted maximum sale count and minimum sale count for month of December is around 1500 which is around the forecasted sales for January .So we can sell the remaining stock by January and February .So risk is minimum for having additional stock during December .
- As the Sparkling wine sales has festive seasonality (the sales are maximum in December so it may be due to Christmas and new year) I suggest them to spend more on marketing during the month of October to December. It may help them to increase sales.
- As the sales are least during January till June, I suggest them to give discount or voucher during these months. It may increase the sales.
